Introduction In structured grid generation, as we have seen, grids are constructed in the solution domain (of the partial differential equations to be solved) in such a way that grid points can be regarded as the points of intersection of curvilinear co-ordinate curves (in two dimensions) or surfaces

the generation of boundary grids before interior cells can be generated. This is an area in which algebraic grid generation is ideal - typically, we want to specify boundary edge point distributions quickly, with a minimum of complexity, and a high degree of repeatability.
