Pulmonary Pharmacology. Pulmonary Pharmacology. This chapter discusses the pharmacotherapy of obstructive airways disease, particularly bronchodilators, which act mainly by reversing airway smooth muscle contraction, and anti-inflammatory drugs, which suppress the inflammatory response in the airways. The chapter focuses on the pulmonary pharmacology of  $\beta_2$  agonists and corticosteroids; their basic pharmacology is presented elsewhere ( see Chapters 12 and 42 ).

Abstract. The approval of macitentan has increased the number of pharmacological treatments of pulmonary arterial hypertension (PAH). Here, we review the effect on PAH of macitentan compared to other endothelin receptor antagonists.

Drugs targeting the endothelin (ET) pathway include the selective ET A receptor antagonist ambrisentan, the ET A /ET B receptor antagonists, bosentan and macitentan, which were recently approved for PAH treatment.

Abstract. Current treatment of pulmonary arterial hypertension (PAH) targets three signalling pathways: the nitric oxide (NO) pathway, the endothelin pathway and the prostacyclin pathway. Riociguat is a soluble guanylate cyclase stimulator, acting via the NO pathway in a new way: unlike other common drugs targeting this pathway (eg tadalafil and sildenafil), riociguat acts independently of endogenous NO.

*A focus on riociguat in the treatment of*

Abstract: Anticoagulation is recommended for prophylaxis and treatment of venous thromboembolism (VTE) (deep vein thrombosis and pulmonary embolism) and/or arterial thromboembolism. The therapeutic arsenal of anticoagulants available to clinicians is mainly composed by unfractionated heparin (UFH), low-molecular-weight heparin (LMWH), fondaparinux and oral vitamin K antagonists (VKA) (i.e. warfarin and acenocumarol).
