Batteries that can store electricity from solar and wind generation farms are a key component of a sustainable energy strategy. Featuring 15 peer-reviewed entries from the Encyclopedia of Sustainability Science and Technology, this book presents a wide range of battery types and components, from nanocarbons for supercapacitors to lead acid battery systems and technology. Worldwide experts provides a snapshot-in-time of the state-of-the art in battery-related R&D, with a particular focus on rechargeable batteries. Such batteries can store electrical energy generated by renewable energy sources such as solar, wind, and hydropower installations with high efficiency and release it on demand. They are efficient, non-polluting, self-contained devices, and their components can be recovered and used to recreate battery systems. Coverage also highlights the significant efforts currently underway to adapt battery technology to power cars, trucks and buses in order to eliminate pollution from petroleum combustion. Written for an audience of undergraduate and graduate students, researchers, and industry experts, Batteries for Sustainability is an invaluable one-stop reference to this essential area of energy technology.

With contributions from leading experts in their respective fields, Metal and Ceramic Matrix Composites provides a comprehensive overview of topics on specific materials and trends. It is a subject regularly included as a final year option in materials science courses and is also of much industrial and academic interest. The book begins with a selection of chapters describing the most common commercial applications of composite materials, including those in the aerospace, automotive, and power generation industries. Section 2 outlines manufacturing and processing methods used in the production of composite materials ranging from basic aluminium matrix composites, through particle reinforced composites, to composites using novel matrix fibres such as titanium-silicon carbide and ceramics. Section 3 is devoted to the mechanical behaviour of different matrix materials and structure-property relations, with particular attention paid to failure and fracture mechanisms. The final section considers those new fibres and composite materials currently in development, including high strength copper composites, porous particle composites, active composites, and ceramic nanocomposites.

The study of the magnetic fields of the Earth and Sun, as well as those of other planets, stars, and galaxies, has a long history and a rich and varied literature, including in recent years a number of review articles and books dedicated to the dynamo theories of these fields.

Against this background of work, some explanation of the scope and purpose of the present monograph, and of the presentation and organization of the material, is therefore needed. Dynamo theory offers an explanation of natural magnetism as a phenomenon of magnetohydrodynamics (MHD), the dynamics governing the evolution and interaction of motions of an electrically conducting fluid and electromagnetic fields. A natural starting point for a dynamo theory assumes the fluid motion to be a given vector field, without regard for the origin of the forces which drive it. The resulting kinematic dynamo theory is, in the non-relativistic case, a linear advection-diffusion problem for the magnetic field. This kinematic theory, while far simpler than its magnetohydrodynamic counterpart, remains a formidable analytical problem since the interesting solutions lack the easiest symmetries. Much of the research has focused on the simplest acceptable flows and especially on cases where the smoothing effect of diffusion can be exploited. A close analog is the advection and diffusion of a scalar field by laminar flows, the diffusion being measured by an appropriate Peclet number. This work has succeeded in establishing dynamo action as an attractive candidate for astrophysical magnetism.

While some travellers look for trouble others unwittingly find themselves in such deep water they are unable to cope. Fortunately for both groups there are men and women worldwide whose job it is to extend a friendly hand. When young James Shea decided to write a book about his father's assistance work as EU representative on the paradisiacal tropical island of Jasmine he discovered that there is a world of crime and corruption very close to home. Pedro Rey, alias "the snake", is the villain. The prominent and successful businessman heads a dangerous criminal organization. Rey becomes increasingly unhappy as James' father keeps getting in his way and upsetting his plans. Gathering material for his book James finds himself plunged into Rey's world. Events escalate, featuring smuggling, kidnapping and murder.

Softcover: This book was originally published in England in 1920. The recorder is the Rev. G. Vale Owen, vicar of Orford, Lancashire. The famous Arthur Conan Doyle, someone who had a great deal of interest in Life after Death, contributed an introduction to all five volumes. The messages contained in this book were also published in a daily newspaper by the owner Lord Northcliffe. As such they were widely read, and widely acclaimed. Rev. George Vale Owen was even asked to go down to London to deliver a sermon on these communications. There did not appear to be any significant theological objections from the Church of England to what was set out, and in fact it was accepted that these communications were genuine "inspirational writings", that the Rev. G. Vale Owen was genuine, and that the writings were of great value. It is curious therefore that they have slipped into relative obscurity only 100 years later, even though they were widely accepted within the Church of England and beyond.
