By adding up all of those withdrawals, we can calculate the human footprint on the planet—a measure of how much we are using the Earth's natural resources. The withdrawals come in six categories: Carbon: A measure of carbon emissions, represented by the amount of forest land that would be needed to sequester carbon dioxide emissions, not including the fraction that is absorbed by the oceans and leads to acidification.

The human footprint map measures the cumulative impact of direct pressures on nature from human activities. It includes eight inputs: the extent of built environments, crop land, pasture land, human population density, night-time lights, railways, roads, and; navigable waterways. Details about the work are provided in the following papers:

[Human Footprint 1993 / 2009](#)

The ecological footprint is a method promoted by the Global Footprint Network to measure human demand on natural capital, i.e. the quantity of nature it takes to support people or an economy. It tracks this demand through an ecological accounting system. The accounts contrast the biologically productive area people use for their consumption to the biologically productive area available within a region or the world. In short, it is a measure of human impact on the environment. Footprint and bioca
