A lung transplant is an operation to remove and replace a diseased lung with a healthy human lung from a donor. A donor is usually a person who's died, but in rare cases a section of lung can be taken from a living donor. Lung transplants are not carried out frequently in the UK. This is mainly because of the lack of available donors.

failure; implications for liver transplantation.

Clinical lung transplantation has seen an early start within the history of solid organ transplantation, marked by the 1963 first lung transplant by James D. Hardy. This was prompted by the seemingly easy way of joining the transplanted organ to the recipient by means of a few well-defined anastomoses, i.e. bronchus, pulmonary artery and pulmonary vein carrying left atrial cuff. The following decade thus witnessed a number of such mostly unilateral lung transplants in several centres, in Germany represented by the two only lung transplants performed by E. S. Bücherl, then at the Neukölln City Hospital in Berlin in 1969. As with most other such attempts these two patients suffered early and lethal graft failure. There was only one single lung transplant patient who lived up to ten months after the transplant at Gent, Belgium, having been operated on by Derom in 1969. The almost universal failure during this initial phase was attributed to bronchial anastomotic insufficiency, pulmonary infection of either the transplanted lung or the left-in-place contralateral lung and a far-reaching lack of knowledge how to cope with transplant rejection. In the early 1970s it had become generally accepted that lung transplantation could not be performed successfully.
